Bis[(2-hexyloxy-3-methyl-5-tert-butyl)phenyl]methane (b). The product was obtained according to the literature procedure relative to alkylation of calixarenes. To a suspension of Gemini a (0.8 g, 2.35 mmol) in dry DMF (24 mL) at 0 °C NaH (60 wt.-% in oil, 0.57 g, 14.1 mmol) was added. The mixture was stirred for 30 min. and then 1-iodohexane (2.13 mL, 14.1 mmol) was added. After 1 h the ice bath was removed and the reaction mixture was stirred for one day. The reaction was quenched with 1 N HCl (70 mL) and the resulting solid filtered on a Büchner funnel. The crude product was dissolved in CH₂Cl₂ (70 mL) and washed with 1 N HCl (3×50 mL). The organic phase was separated, dried over anhydrous Na₂SO₄ and evaporated under reduced pressure to obtain a yellowish oil. The residue was purified by flash column chromatography on silica gel (eluent: CH₂Cl₂/MeOH= 99:1) to obtain the pure product as a colourless oil in 90% yield. 

Bis[(2-hexyloxy-3-methyl-5-nitro)phenyl]methane (c). The product was obtained according to the general procedure for the ipso nitration of calixarenes. To a solution of b (1.05 g, 2.07 mmol) in trifluoroacetic acid (4.70 mL, 61.2 mmol), NaNO₃ (3.45 g, 40.7 mmol) was added and the mixture turned orange. After one night the reaction was stopped with addition of water (100 mL) and extracted with CH₂Cl₂ (2×50 mL). The separated organic layer was washed with water (75 mL), dried over anhydrous Na₂SO₄ and concentrated under reduced pressure to obtain a yellowish oil. The residue was purified by flash column chromatography on silica gel (eluent: hexane/ethyl acetate= 98:2) to obtain the pure product as a colourless oil in 60% yield.

Bis[(2-hexyloxy-3-methyl-5-amino)phenyl]methane (d). The product was obtained according to the general procedure for the nitro reduction of calixarenes. To a solution of c (0.22 g, 0.45 mmol) and hydrazine monohydrate (0.22 mL, 4.52 mmol) in ethanol (14 mL), a catalytic amount of Pd/C was added and the reaction mixture was stirred and refluxed overnight. The solvent was then removed under reduced pressure, the residue dissolved in CH₂Cl₂ (50 mL) and the catalyst filtered off through a paper filter. Pure amine d was obtained after evaporation of the solvent under reduced pressure as a light yellow oil in 78% yield. ¹H NMR (300 MHz, CDCl₃): δ 6.34 (d, J = 2.7 Hz, 2H, ArH), 6.17 (d, J = 2.7 Hz, 2H, ArH), 3.90 (s, 2H, ArCH₂Ar), 3.69 (t, J = 6.9 Hz, 4H, OCH₂CH₃), 3.30 (bs, 4H, NH₂), 2.23 (s, 6H, ArCH₃), 1.76 (quint, J = 6.9 Hz, 4H, OCH₂CH₂), 1.46 (bquint, J = 5.4 Hz, 4H, OCH₂CH₃CH₂), 1.42-1.28 (m, 8H, O(CH₂)₃CH₂CH₂), 0.91 (t, J = 6.9 Hz, 6H, CH₂CH₃); ¹³C NMR (75 MHz, CDCl₃): δ 148.5, 142.0, 134.6, 131.4, 115.7, 115.0, 73.2, 31.8, 30.3, 29.6, 29.0, 25.8, 22.6, 16.4, 14.0; MS (m/z): [M + H]+ calcld for C₂₇H₄₆N₂O₂, 427.3; found, 427.5, [M + Na]+ calcld, 449.3; found, 449.5.

Bis[(2-aminopropoxy-3 methyl)phenyl]methane (f). The compound was obtained according to literature procedure.²¹

**Bis-[2-[3-L-Arg-amino(propoxy)-3-methylphenyl]methane, tetra-hydrochloride (8).** The trifluoroacetate anion of the TFA tetra-salt resulting from the deprotection reaction was exchanged with chloride by dissolving (4x) the solid in a methanol solution of conc HCl (pH= 3-4) followed by evaporation. The pure product was obtained as a white solid after liophilization, in 85% yield. mp: 184 °C dec.; ¹H NMR (300 MHz, CDCl₃): δ 7.03 (d, J = 6.9 Hz, 2H, ArH), 6.90 (t, J = 6.9 Hz, 2H, ArH), 6.82 (d, J = 6.9 Hz, 2H, ArH), 4.02 (s, 2H, ArCH₂Ar), 3.94 (bs, 2H, NHCOCH₃), 3.78 (bt, 4H, OCH₂), 3.46 (bs, 4H, OCH₂CH₂CH₂), 3.22 (bs, 4H, NCNHC₂H₅), 2.28 (s, 6H, ArCH₃), 2.11-1.80 (bm, 8H, OCH₂CH₂ and COCH₂CH₂), 1.70 (bs, 4H, COCH₂CH₂); ¹H NMR (300 MHz, D₂O): δ 7.19 (d, J = 7.0 Hz, 2H, ArH), 7.05 (t, J = 7.0 Hz, 2H, ArH), 6.95 (d, J = 7.0 Hz, 2H, ArH), 4.02 (s, 2H, ArCH₂Ar), 3.95 (t, 2H, J = 6.6 Hz, COCH₃), 3.83 (t, 4H, J = 6.3 Hz,
DNA preparation and storage. Plasmid DNA was purified through cesium chloride gradient centrifugation. A stock solution of the plasmid 0.35 µM in milliQ water (Millipore Corp., Burlington, MA) was stored at -20 °C.

Electrophoresis mobility shift assay (EMSA). Binding reactions were performed in a final volume of 14 µL with 10 µL of 20 mM Tris/HCl pH 8, 1 µL of plasmid (1 µg of pEGFP-C1) and 3 µL of compound at different final concentrations, ranging from 25 to 200 µM. Binding reaction was left to take place at room temperature for 1 h; 5 µL of 1 g/mL in H2O of glycerol was added to each reaction mixture and loaded on a TA (40 mM Tris-Acetate) 1% agarose gel. At the end of the binding reaction 1 µL (0.01 mg) of ethidium bromide solution is added. The gel was run for 2.5 h in TA buffer at 10 V/cm. EDTA was omitted from the buffers because it competes with DNA in the reaction.

Melting curves determination. Melting curves of the linearized pEGFP-C1 DNA (0.5 nM) and of the same plasmid in the presence of ligand (16 µM) in buffer solution (4 mM Hepes, 10 mM NaCl, pH 7.4) were registered on a PerkinElmer UV-vis LAMBDA-Bio 20 spectrophotometer in the range 20-90 °C and following emission at 260 nm.

Fluorescence studies. Ethidium Bromide Displacement Assays (excitation at 530 nm, emission at 600 nm) were performed collecting on a PerkinElmer LS 55 the emission spectra of buffer solutions (4 mM Hepes, 10 mM NaCl, pH 7.4) of 50 mM ethidium bromide (relative fluorescence = 0), mixture of 0.5 nM plasmid DNA (pEGFP-C1) and 50 mM ethidium bromide (relative fluorescence = 1) and after addition of increasing amounts of ligand. Experiments with Nile Red were performed on the same instrument (excitation at 530 nm) in buffer solutions (4 mM Hepes, 10 mM NaCl, 2 mM MgCl2, pH = 7.4) of the dye (0.2 µM) and mixture of the dye with ligand (2 µM) and pEGFP-C1 DNA (0.5 nM).

Sample preparation for AFM imaging. DNA samples were prepared by diluting the plasmid DNA to a final concentration of 0.5 nM in deposition buffer (4 mM Hepes, 10 mM NaCl, 2 mM MgCl2, pH = 7.4) either in the presence or absence of ligands. When needed, ethanol at a defined concentration was added to the deposition buffer prior to addition of DNA and calixarenes. The mixture was incubated for 5 min at room temperature, then a 20 µL droplet was deposited onto freshly-cleaved ruby mica (Ted Pella, Redding, CA) for 1.5 min. The mica disk was rinsed with milliQ water and dried with a weak nitrogen stream. AFM imaging was performed on the dried sample with a Nanoscope IIIA Microscope (Digital Instruments Inc. Santa Barbara, CA) operating in tapping mode. Commercial diving board silicon cantilevers (NSC-15 Micromash Corp., Estonia) were used. Images of 512×512 pixels were collected with a scan size of 2 µm at a scan rate of 3-4 lines per second and were flattened after recording using Nanoscope software.

Cell culture and transient transfection assay. RD-4 [human Rhabdomyosarcoma cell line (obtained from David Derse, National Cancer Institute, Frederick, Maryland)], C2C12 [mouse myoblast; ATCC (#CRL-1772)], N2a [mouse neuroblastoma; ATCC (#CCL-131)], EADSc [Equine Adipose
Derived Stromal Cells primary culture was obtained as described in Donofrio, G. et al *Cell Biology* 11, 73 (2010)], COS-7 (African Green Monkey Kidney cells; ATCC (#CRL-1651)], VERO (African Green Monkey Kidney Cells; ATCC (#CCL-81), HEK 293 (Human embryo Kidney cells; ATCC (#CRL-1573)], Ishikawa (Human Endometrial cancer cells; ECACC (#99040201]) and HeLa (Human Cervix Adenocarcinoma; ATCC (#CCL-2)] were grown in EMEM medium containing NEAA, 10% FBS, 2 mM L-glutamine, 100 IU/mL penicillin and 100 µg/mL streptomycin. All cultures were incubated at 37 °C in a humidified atmosphere containing 5% CO₂. Cells were subcultured to a fresh culture vessel when growth reached 70-90% confluence (i.e. every 3-5 days) and incubated at 37 °C in a humidified atmosphere of 95% air-5% CO₂. Transfections were performed in 24 well plates, when cells were 80% confluent (approximately 5x10⁴ cells) on the day of transfection. 2.5 µg of plasmid and different concentrations of ligands were added to 1 mL of serum-free medium (DMEM, 2 mM L-glutamine and 50 µg/ml), mixed rapidly and incubated at room temperature for 20 min. When used, serum was added at this point to the transfection solution. Following the removal of the culture medium from the cells, 0.5 mL of transfection mixture were carefully added to every well. Lipoplex formulations with helper lipid were prepared adding a 2 mM ethanol solution of DOPE to plasmid-ligand mixture at 1:2 ligand:DOPE molar ratio, where ligand concentration was kept to 10 µM. These solutions administered to the cells were completely clear and homogenous. LTX™ transfection reagent was used according to manufacturer's protocol as positive transfection control. The mixture and cells were incubated at 37 °C in a humidified atmosphere of 95% air-5% CO₂ for 5 h. Finally, transfection mixture was removed and 1 mL of growth medium added to each transfected well and left to incubate for 72 h. Five fields were randomly selected from each well without viewing the cells (one in the centre and one for each quadrant of the well) and examined. The transfected cells were observed under fluorescence microscope for EGFP expression. Each experiment was done three times. Statistical differences between treatments were calculated with Student's test and multifactorial ANOVA.

**MTT survival assay for cell viability determination.** 2000 cells/well (in 50 µL) were seeded in a 96 wells plate, cells were grown in complete medium (90% DMEM, 10% FBS, 2 mM L-glutamine, and 100 IU/mL penicillin, 10 mg/mL streptomycin) and incubated at 37 °C overnight. The day after 50 µL of scalar dilution of calixarenes, alone or with DOPE, were added to the cells and incubated at 37 °C overnight. Calixarenes were tested from 40 to 2.5 µM and DOPE from 80 to 5 µM. 24 hours later, 10 µL of complete medium containing MTT (5 mg/mL) was added to each well and incubated for 6 h. Then, after the addition of 100 µL per well of solubilisation solution (10% SDS in HCl 0.01 M) cells were incubated at 37 °C overnight. MTT survival assay for cell viability determination in transfection conditions was performed with the same procedure at 24 h from transfection (see transient transfection assay). Specific optical density for each well was measured at 540 nm, using 690 nm as reference wavelength in an SLT-Lab microreader (Salzburg, Austria). Each experiment was done three times and each treatment was performed with eight replicates. Statistical differences among treatments were calculated with Student's test and multifactorial ANOVA.

**Luciferase reporter assay.** Luciferase reporter assay was performed with a Dual Luciferase Reporter Assay System kit (Promega) with minor modifications. At 48 h from the treatment, cells were washed with PBS, lysed with 100 µL of lysis passive buffer by freeze-thawing at −80 °C. 10 µL of the cell lysate was added to 50 µL of LAR and Luciferase activity were determined with a PerkinElmer Victor Multilabel Counter, according to the manufacturer's specifications. Individual assays were normalized for Renilla Luciferase activity with a second reading, adding 50 µL of Stop & Glo substrate.
